

Christian, this screen is currently behaving as a one-time transactional entry form. Under our aligned Mental Bank design, it needs to shift into two clearly separated functions.

Here is how the functionality must change.

1. This screen should NOT be used to DEFINE Value Events

Right now, this screen is doing both:

- Creating Value Events
- Logging Value Events

That conflicts with the Mental Bank philosophy.

Value Events must be:

- Pre-defined
- Intentionally designed
- Managed in the dedicated Value Events screen

This screen should no longer be a place where new Value Events are invented.

2. This screen becomes a “Log Execution” screen only

Its purpose should be:

To record completion of an existing Value Event — not create one.

Required functional shift:

Replace free-form text entry with:

- A dropdown or picker:
Select Value Event
 - This list pulls only from previously defined Value Events.
-

3. What should remain editable here

This screen should stay focused on execution tracking:

- Units / Time (e.g. 1.5 hours)
- Unit Type (hours, flat, occurrence if added later)
- Auto-filled Pay Rate (derived from event definition but overridable if needed)

The user is saying:

“I performed this action today.”

Not

“I am creating what matters right now.”

4. What should be removed or relocated

REMOVE from this screen:

- The ability to name a new Value Event
- Any implication that this is where behavioral planning happens

ADD instead:

- A clearly visible Value Event selector
 - Optional small text note:
“You are logging completion of an existing Value Event.”
-

5. New Flow Summary

Correct flow should be:

1. User defines Value Events in Value Events screen
 2. User executes action during the day
 3. User logs execution here via Ledger → + → Value Event
 4. App calculates reward based on pre-defined structure
-

6. Instruction-ready summary for Replit

You can give your developer this directly:

VALUE EVENT ENTRY SCREEN – FUNCTION CHANGE

- Convert this screen from “Create Value Event” to “Log Value Event Completion”.
- Replace the free-text name field with a dropdown list populated from the Value Events database.
- The user selects which predefined event they completed.
- Keep editable fields:
 - Units / Time
 - Unit Type
 - Pay Rate (default from event definition)
- Add label or microcopy:

“Select the Value Event you completed.”

This screen must only record performance, not define intent.

This change ensures the system preserves:

- Intentional structure
- Behavioral clarity
- Psychological reinforcement consistency

If you'd like, I can also provide the instructional text for a “?” icon here explaining the difference between defining vs logging a Value Event.
